(United Nations, 2015). However, the state of healthcare facilities in some developing countries contradicts their development. Some countries lack the foundations of effective healthcare systems (Petersson et al., 2017). Specifically in Nigeria, there is critical shortage of health care workers (National Strategic Health Development Plan II (2018-2022), 2018). There is also an inequitable distribution of health care workers between rural and urban areas in even between different regions and states (Okpam, 2016). For instance, Nigeria (Okpam, 2016). For instance, Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are whether directed at people or communities (Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are whether directed at people or communities (Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010).

Many countries are making concrete effort to improve the quality of healthcare delivery because it is *sine qua non* to the sustainability and viability of any country's economic and social growth (Eme et al., 2014). Healthcare is described as all commodities and services aimed to enhance health, including preventive, curative, and palliative treatments, whether directed at people or communities (Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). Many countries are working towards global health places that provide health care (Ferlie & Park, 2005) and health facilities are Shorrell, 2010). ## INTRODUCTION

**Keywords:** Aged, Healthcare, Health Facilities and Services, Preferences, Rural

Over the years, there has been a growing recognition of the challenges of aged healthcare and care preferences especially in the rural aged and the need for it to be addressed. Hence, this study examined factors influencing aged preferences for healthcare services in three rural communities of Ayedade Local Government Area of Osun State by adopting combinations of methods. A total of 127 structured questionnaires were administered to the elderly (60 years and older) in the designated locations. In addition to this, nine people were interviewed in the three communities studied. It was revealed that health personnel such as doctors, nurses, among others were rarely available and those available were not responsive at the healthcare facilities. Also, the healthcare facilities had limited number of rooms and the available rooms and beds were in poor conditions. The study further revealed traditional care as the aged most preferred healthcare in the three communities and factors such as distance to the health, long waiting time and literacy level were found to be influencing their preferences. The study suggested the need to put into consideration aged preferences in planning choices connected to health care services especially those in the rural areas. Also, there is the need for healthcare services provided to be monitored appropriately by the relevant government agencies.

Factors Influencing Aged Preferences for Healthcare Services in Selected Rural Communities of Ayedade Local Government Area, Osun State

Town. Three rural settlements (Ajule, Osun State, with headquarters in Gbonogam Ayedade) is a Local Government Area in **Study Approach and Design**

analyses. Data tool and instrument, Data sources, Study Approach, Data subsections; Study Approach was divided into four (4) methodologies used for health care services and facilities. The focused on the aged preferences for health the study. The methodology for this study This section presents the methodology for

## RESEARCH METHODOLOGY

women). preferences of the aged (both men and factors influencing the perspectives and study, on the other hand, examined the and preferences of aged women. This and preferences of aged women, with little or no regard for the viewpoints women, particularly pregnant women, research placed a strong emphasis on why pregnant placed a strong emphasis delivery. It could be observed that this about service delivery points, fear of facilities were among the major reasons and a lack of female doctors in health care having a career in delivery at a hospital, about service delivery points, fear of facility, lack of knowledge and awareness transportation to reach the nearest health to decision-making in the family, lack of religious facilities, limited access of women revealed that poverty, traditional views, health-care preferences. The study examined factors influencing women's in addition, Sarker *et al.* (2016) also for bypassing the primary health facilities, were considered to be influencing factors hours of the primary health-care facilities distributions, and the inconsistent opening study discovered that the shortage of lack of basic equipment, inadequate health-care providers at local facilities, health-care providers at local facilities, secondary and tertiary level facilities. The factors that influence a patient's decision to bypass the primary level of care to go to experiences in order to understand the and health-care providers' perceptions and services and facilities in rural areas.

Koce *et al.* (2020) explored the patients'

and facilities; however, this study focused women's choices for health care services areas. The study was centred on pregnant areas. Maternal mortality connected with maternal mortality addressing the problem of is critical in addressing the problem of not to use accessible health-care treatments throughout pregnancy and delivery. Also, throughout pregnancy and delivery. Also, eliminate obstacles to health-care understanding women's views can help understand women's views can help northern India. According to the study, health care services during pregnancy and child birth in a rural community in women's perspectives and preference for service. Bredesen (2013) investigated examined aged preferences for health-care prolonging treatment. This study also associated with preferences for life-extension patients, higher survival estimates were preferring CPR. However, in both groups, quality of life was associated with middle-aged patients, better perceived documented discussions while the case of more therapeutic interventions and more older patients, preference for life-extension patients, preference for life-extension Rose *et al.* (2016) study revealed that for facilities and services in the study area.

study will also examine the state of health infrastructures. In line with the above, this professionals to receive training, and bad lack of opportunity for health analysed facilities were a lack of staff, a services to the participants using the provision of high-quality health-care the primary issues preventing the potential obstacles. The study found that services under in order to identify the enrolees with appropriate health-care providing participants or potential selected health facilities' suitability for Rahem *et al.* (2019) evaluated the appropriate management of health-care resources. In a related development, order to improve funding and guarantee services to be inventoried property in order to improve funding and guarantee recommended the need for medical service delivery, hurting coverage and

The state of healthcare facilities and services influenced aged preferences for healthcare services. This section presents the results and discussions to the research questions of this study in three echelons which include: state of health care facilities and services in the study area.

### State of Healthcare Facilities and Services

The state of healthcare facilities and services is divided into Healthcare Government area. The analysis and explanation is divided into Healthcare Government area. Local communities of Ayedade LGA facilities and services in the selected rural area explained the state of healthcare utilization of the state of healthcare facilities and services. This section gives a detailed analysis and utilization of healthcare facilities. This utilization of facilities the preference and services influences the preference and services in the study area.

### RESULTS AND DISCUSSION

Quantitative data obtained were analyzed using analytic method from SPSS package. Descriptive statistics (frequencies and percentages) were used to examine the state of healthcare facilities to ascertain age preference for healthcare facilities and services; aged preference for healthcare facility and also the factors influencing age preference for healthcare facilities. Quality in the selected rural communities, facility in the selected rural communities, facility in the selected rural communities, aged preference for healthcare facility and also the factors influencing age preference for healthcare facilities and services to ascertain the state of healthcare facilities to examine the state of healthcare facilities and services; aged preference for healthcare facility and also the factors influencing age preference for healthcare facilities. Quality in the selected rural communities, facility in the selected rural communities, aged preference for healthcare facilities and services to ascertain the state of healthcare facilities to examine the state of healthcare facilities and services; aged preference for healthcare facility and also the factors influencing age preference for healthcare facilities.

#### Data Analysis

S/N	SELECTED	NAME OF SELECTED	NUMBER OF	COMMUNITIES
1	Ayedade	Ajule, Arromi Owu, Support,	3	

Table 1: Selected communities in the study area

Arromi Owu, Support) were selected through simple random selection process by assigning each settlement in the same probability of being chosen from Nigerian Social and Economic Research Institute, 1981) defined a rural area from the demographic point of view as a settlement with less than 20,000 inhabitants. Similarly, Aliko (2004) described the rural areas as areas lacking social amenities that are usually identified with the urban areas.

The primary data used were qualitative data obtained in-depth interviews which were involved in-depth interviews which were ended and semi-structured. The open ended and semi-structured interview was tape recorded, and each interviewee was asked about their experiences of the elderly for health care services and facilities.

#### Data Tool and Data Instrument

The primary data used were qualitative data and quantitative data. The qualitative data was tape recorded from participants time on the tape ranged from 10 to 20 minutes. The interviewer used progressive focusing to ask the participants new and the most relevant questions. In each community, an elderly participant's new and the most relevant questions were chosen for interviews.

There were thirty-two registered health staff, as well as any available male and female, as well as any available questions. In each community, an elderly participant's new and the most relevant questions were chosen for interviews.

Area of Osun State. The quantitative data involved using a snowball sampling approach in the selection of the aged household. In this case an aged was approached in the selection of the aged number of 120 questionnaires were

retrieved and analysed.

Factors influencing Aged Preferences for Healthcare Services in Selected Rural Communities to ensure that every settlement had the same probability without replacement. This was contained within each settlement. The drawn from the or settlement was then drawn from the thoroughly mixed together, each number placed in a container. After they have been placed in a piece of paper and written in a piece of paper and number, written in a piece of paper and respective local government area by assiging each settlement in the same probability of being chosen from Nigerian Social and Economic Research Institute, 1981) defined a rural area from the demographic point of view as a settlement with less than 20,000 inhabitants. Similarly, Aliko (2004) described the rural areas as areas lacking social amenities that are usually identified with the urban areas.

Arromi Owu, Support) were selected

themselves available. The necessary health personnel such as the medical doctor, pharmacist, and laboratory technician are not available here. Most of the aged women visit the health center at least once a year. I can do as a nurse is often a need for them to see a medical doctor but what I can do as faculty, there is often a need for the health times the aged women visit the health center. This agrees with the World Bank Report (2010) which says that in Africa, most urban local government areas have more staff than those located in rural predominantly rural local government areas. Aluko-Arowolo (2005) explained that life chance resources like water, energy (electricity) good roads, shelter, school for children, employment for spouses which are likely to attract these

I am the only health personnel present at the health care facility. Most of the health care personnel assigned to this area are not available and this is a rural community. Bad roads, limited economic opportunity, health care facility don't make themselves available and this is because this is a rural community. Also, one of the nurses on duty in Ajule community was interviewed, she explained: "Most of the times I visit the health center; I get discouraged by the non-availability of health personnel and specialist. This is one of the reasons I opt for traditional health care. I can't actually blame the health care if it's not coming around, the roads are very bad and this place is very far away from here".

Also, one of the nurses on duty in Ajule community was interviewed, she explained: "I am the only health personnel don't make opportunities and lots more are reasons why health personnel don't make available and this is because this is a rural area. This is a rural area, I am the only health personnel present at the health care facility. Most of the health care personnel assigned to this area are not available and this is a rural community. Bad roads, limited economic opportunity, health care facility don't make themselves available and this is because this is a rural community".

One of the interviewed aged responded in

Table 3 revealed the respondents' waste management practices etc. within the healthcare environments (Erimosho, 2006). Table 3 revealed the respondents' indication of the physical structure of the healthcare facilities, it was discovered that From the analysis, it was found that many of the respondents (55.8%) indicated that the healthcare structures were available but not functioning (a very indicated the physical health structure as a source of water) while 13% of the From this analysis, it can be inferred that the state of physical structure of the healthcare facilities are not encouraging.

The Physical structure of the healthcare facilities entails the buildings and other fixed structures such as water, good access roads, electricity, rooms, hospital beds, rural areas. inadequacy of health care system in the standard, thus further complicating the meet the World Health Organization standards at 21 (World Health Organization, 2017). However, findings from this study indicated that they did not meet the World Health Organization standards at 12 while that of population is estimated to 100 000 nurses and midwives to 100 000 population is estimated at 12 for doctors per 100 000 of staffing for nurses per 100 000 Organization standard of national average madequate. The World Health Organization standards at 21 (World Health Organization, 2017). However, findings from this study indicated that they did not meet the World Health Organization standards at 21 (World Health Organization, 2017). However, findings from this study indicated that they did not meet the World Health Organization standards at 12 while that of population is estimated to 100 000 nurses and midwives to 100 000 population is estimated at 12 for doctors per 100 000 of staffing for nurses per 100 000 of staffing for doctors per 100 000

and how am I supposed to know why I have pain. I think they treat people better than doctors and nurses in the government having to pay exorbitant price for healthcare facility. Also, I can't imagine having to go through experiments in the hospitalised by the services offered by the healthcare facility. If it is not a serious illness especially if it is to treat myself at home especially saves me of the stress of having to find my way to the healthcare facility. It helps me save time and cost of transportation; Furthermore, 42.5% of the respondents prefer to treat myself at home especially if it is not a serious illness because it saves me of the stress of having to find my way to the healthcare facility.

Another aged respondent in Ajule explained:

"I prefer to treat myself at home especially if it is not a serious illness because it saves me of the stress of having to find my way to the healthcare facility. It helps me save time and cost of transportation".

Table 4 revealed that apart from healthcare facility, many of the respondents (60.8%) prefer traditional healthcare while 39.2% of the respondents prefer self-medication. This according to the aged respondents during interview is as a result of the state of the healthcare facility in the study area. Some of the respondents complained about the issue of accessibility, friendliness and courtesy of healthcare personnel, financial implication of treatment and lots more. One of the respondents in Support was asked why she preferred traditional healthcare, she responded:

"If I go to the traditional healer I know what is wrong and why you have that pain, they are very rude. They even ask you unlike the health workers in the hospital, you do not have to be treated anywhere. You are offered an African mai to sit down, you take your shoes off, they listen to your ones. When you knock, it is homely, you going to be treated humbly from a traditional healer I know the
