## **EDITORIAL POLICY**

The Journal of Agriculture and Environment is an international journal which publishes, biannually, scientific papers and short communications in all areas of agriculture and their interactions with the environment.

Research papers are reviewed by authorities in the relevant fields. A research paper is accepted on the basis of originality and contribution to scientific knowledge. The final decision on acceptance of papers for publication

## EDITORIAL CORRESPONDENCE

## **ABSTRACT**

Accessibility and utilization of agro-services by crop production farmers in Accessionity and united and in this study. Multi-stage sampling Abuja-rell, lugella technique was used to select 346 respondents for the study from three Area Councils in FCT. Validated interview schedule with reliability coefficient of 0.74 was used for data collection. Data collected were analyzed using descriptive statistics and multinomial logit regression model. The results indicated that the mean age of the respondents was 48 years. Only 10.7% of them had tertiary education. Majority (84.1%) of the respondents were members of farmers' associations. Findings of the study revealed that the services of agro-inputs retailers (94.8%) tractor hiring schemes (87.0%), agricultural extension agencies (75.1%), fertilizer companies (65.0%) and agricultural finance institutions (51.4%) were accessible to the respondents. Thus, agro-services of agro-input dealers ( $\bar{x}$ =3.15), extension agencies  $(\bar{x}=3.07)$  fertilizer companies  $(\bar{x}=2.62)$  and agricultural finance institutions  $(\bar{x}=2.51)$  were well utilized. Perceived economic benefits of the services, educational level, membership of associations and income had exclusively positive significant influence on the utilization of agro-services by the respondents. High cost of services (60.1%), far distances to the sources of services (54.0%) services (54.9%) and unavailability of facilities (45.7) were the major challenges for accessibility of facilities (45.7) were the major challenges for accessibility and utilization of agro-services in the study area.

Thus, it was concluded the accessibility and utilization of agro-services in the study area. Thus, it was concluded that the agro-services operated by private service providers were more accessible and utilized by the respondents than the services provided by the respondents that services provided by the government. It was recommended that agricultural extension agents should appear to the control of the extension agents should encourage the farmers to access agro-services in group through their associations of the farmers to access agro-services in access agro-services. group through their associations, for enhanced capacity to use agro-services at reduced prices. It was also as for enhanced capacity to use agro-services workers at reduced prices. It was also suggested that agricultural extension workers should educate the farmers more on the economic benefits of using agro-

services to maximize the usage of the services and output by the farmers. Keywords: Accessibility; Utilization; Agro-services; Crop Production

Agro-services play an important role in many aspects of agricultural development sense, agricultural formula formula formula sense, agricultural formula formu grass root level. In broad sense, agricultural foundations, agro-business firms, companies, consulting firms, non-governmental organizations, fertilizer companies, associations agree-based inductions companies, consuming thins, non-governmental organizations, tertilizer companies, farmers' cooperative associations, agro-based industries, agricultural extension farmers cooperations, agro-based industries, agricultural extension organizations, agro-input centres among others are considered as agro-service providers. organizations, agro-services are rendered by both public and private service providers, but Generally, agree over the years has shown that the public services are not enough and doing well. experience over the factor of the public sector extension was not doing well and For instance, Rivera (1991) reported that public sector extension was not doing well and For installee, tartier of the parties sector extension was not doing well and being relevant worldwide. On the other hand, Sureshkumar (1997) stressed that information being relevant normation as a supportive service could be more effective with private extension services in the as a supportive services in the agricultural sectors. According to Van den Ban (1996), more research is needed on the agricultural alternative service providers and their role in agricultural development.

Similarly, Anonymous (2001) stated that private sectors had a distinct comparative advantage in product development and delivery. The researcher further stressed that the advantage fueled much of the world's economic growth and increased wealth for many countries. Pray (2002) reported that private research appeared to be increasing in the two largest economies of India and China, especially in the seed and biotechnology industries. In many developing countries like Nigeria, farmers have very limited access to agroservices which in most cases result to low or non-utilization of the services. Consequently, agricultural production techniques have remained rudimentary and productivity as well as income of Nigerian farmers is less than normal, hence farming families remain poor. It is against this background that this study examined the accessibility and utilization of agroservices by farmers, in order to provide useful information for improving access and use of agro-services among famers. The specific objectives of the study are to: describe the socioeconomic characteristics of the respondents; examine the accessibility of agro-services by respondents; assess the utilization of agro-services by respondents; determine the factors influencing utilization of agro services by respondents; and ascertain the challenges for the accessibility and utilization of agro-services in the study area.

### MATERIALS AND METHODS

## Study Area

This study was carried out in Abuja Federal Capital Territory (FCT). The FCT falls between Latitudes 8°25' and 9°20' North and Longitude 6°45' and 7°39' East. Yearly rainfall ranges from 1,100mm to 1,600mm, with average annual temperature of 25.7°C. The territory is located in Guinea Savannah Agro-ecological zone of Nigeria and some of the crops cultivated are yam, maize, sorghum, millet, cowpea, soybean, rice and groundnut. While livestock reared include goat, sheep, cattle and chicken. Major ethnic groups in FCT are Gbayi, Koro, Gede, Bassa, Gwandara and Ganagana among others (Federal Capital

## Sampling Technique

All farmers in the FCT constituted the population for this study. Multistage Sampling technique was adopted for this study. In the first stage; three out of six Area Councils were Abaii and Bwari Area Councils. In the Councils were randomly selected. They are Kuje, Abaji and Bwari Area Councils. In the selected three Area Councils were second stage, two extension blocks from each of the selected three Area Councils were randomly selected. They are Kuje, Avaji and Dwalf Area Councils were randomly selected three Area Councils were randomly selected to make a total of six extension blocks. In the third stage, two extension

Primary data were obtained from the respondents through the use of questionnaire Data Collection and Analysis primary data were obtained from the response characteristics, accessibility and interview schedule. Data were elicited on socio-economic characteristics, accessibility and interview schedule. Data were elicited on challenges for accessibility and utilization of agree-services as well as on challenges for accessibility. and interview schedule. Data were enclied on social as on challenges for accessibility and utilization of agro-services as well as on challenges for accessibility and utilization of agro-services as well as on challenges for accessibility and utilization of agro-services as well as on challenges for accessibility and utilization of agro-services as well as on challenges for accessibility and utilization of and utilization of agro-services as well as off channels are services as well as off channels are services. Age, educational level and farming experience were measured in years, agro-services. Age, educational level and income were measured in number and Naira, respectively contained and income were measured in number and Naira, respectively contained and the services as well as off channels are services. agro-services. Age, educational level and in number and Naira, respectively. Sex, cost while family size and income were measured in number and access to motoral. while family size and income were incomes and access to motorable roads of services, place of residence, membership of associations and access to motorable roads of services, place of residence, included as dummy variables. Perceived economic benefits of agro-services were were measured as dummy variables of bigh benefit = 3 low benefit = 2 and low benefit = 3 low benefit = 2 and low benefit = 3 low benefit = 2 and low benefit = 3 l were measured as durning variables.

were measured using 3-points Likert type scale of high benefit = 3, low benefit = 2 and no benefit measured using 3-points Likert type scale of high benefit = 3, low benefit = 2 and no benefit measured using 3-points Direct GPS

=1. Average distance to sources of services was measured in kilometres. Accessibility of agro-services: seed companies, inputs retailers, fertilizer companies, agricultural finance institutions, tractor hiring schemes, weather information agency, agricultural extension organizations and irrigation services agency were ascertained by asking the respondents to indicate the type of services they had access to. While the utilization of agro-services was measured using a 4-points Likert type scale of always utilized=4, sometimes utilized =3, hardly utilized = 2 and not utilized = 1. Thereafter, the values of the scale were added up and the sum was divided by the number of the values of the scale to obtain 2.5. Thus, any agro-service with mean of 2.5 and above suggests utilization of that agro-service, while below 2.5 depicts no utilization of the service. Challenges for the accessibility and utilization of agro-services were determined by asking the respondents to indicate the constraints for accessibility and utilization of agro-services. Objectives one, two, three and five of the study were achieved using descriptive statistics while objective four was achieved using multinomial logit regression. The model is specified implicitly as:

 $Y = f(X_1, X_2, X_3, X_4, X_5, X_6, X_7, X_8, X_9, X_{10}, X_{11}, X_{12})$ 

The explicit form of the model is specified as:

Logit (Y) =  $\alpha + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \cdots + \beta_n x_n$ 

Y= Utilization of agro services (No utilization of service=1, utilization of 1-3 services=2, utilization of 4-6 services=2 utilization of 4-6 services =3, and utilization of 7-8 services =4)  $X_2 = Sex (female=1, male=0)$ 

```
X_3=Educational level (years)

X_4= Farming experience (years)

X_5= Cost of services (costly = 1, not costly=0)

X_6= Perceive economic benefits of services (3point Likert scale)

X_7= Average distance to sources of services (km)

X_8= Place of residence (town = 1, village=0)

X_9= Income (naira)

X_{10}= Family size (number)

X_{11}= Membership of farmers' associations (member=1, otherwise = 0)

X_{12}=Access to motorable roads (yes=1, no=0)

\alpha = constant

\beta_1 + \beta_{12}= regression coefficients of variables
```

### RESULTS AND DISCUSSION

### Socio economic Characteristics of the Respondents

Results in Table 1 indicated that the mean age of the respondents was 48 years. This implies that the respondents were in their active productive years which can motivate the respondents to demand for the needed agro-services because of the innovativeness of this age range.

This result is in line with the findings of Ani (2007) who reported that majority of farmers were in their active ages. Table 1, also revealed that 36.4% and 33.5% of the respondents attained primary and secondary education respectively. However, only 6.6% and 4.1% respectively had NCE/ND and University education; suggesting that majority of the respondents had one form of formal education or the other, which could be instrumental to the accessibility and utilization of agro-services. Similarly, Table 1 showed that the mean household size of the respondents was 7 persons. Furthermore, Table 1 indicated that expected to ease movement of service providers and facilitate access/utilization of services implying an enhanced capacity to access and use agro-services.

More so Table 1

More so, Table 1 revealed that the mean farm size of the respondents was 1.9 hectares. This is an indication that most of the respondents were into small scale farming. The size of farms can influence the demand for agro-services. Furthermore, Table 1 showed 4.6% of the respondents received one extension service in a year, while 29.5% and finding shows that agricultural extension contact among the farmers was low in the study farmers in Niger State were not receiving regular extension services.

## Accessibility of Agro-services

Result in Table 2 showed that 94.8% of the respondents had frequent access to a implements. The accessibility of agro-inputs such as agro-chemicals and other relation of agro-inputs dealers by majority of the respondents compared to the proliferation of agro-inputs outlets in the area.

gro services by respondents

Agricultural That Tractor hiring services	301	2.3	
	8	79.8	
Irrigation services	la responses		

Source: Field survey, 2018; \*Multiple responses

Also, Table 2 indicated that almost 87.0% of the respondents had regular access to the tractor hiring services operated mostly by private service providers in the area. More so, findings in Table 2 revealed that 79.8% of the respondents in the study area accessed agricultural extension services through the extension workers stationed in the villages. Similarly, 65.0% and 51.4% of the respondents had access to the services of fertilizer companies and agricultural finance institutions, respectively. However, the services of seed companies, weather information and irrigation agencies mostly operated by government establishments were not well accessed; suggesting that the application of these services by farmers may be minimal or uncommon. It generally implies that the agro-services operated by private service providers were more accessible than the services provided by government owned parastatals. This finding corroborates the findings of Anonymous (1999) who reported that National Seed Corporation owned by government met only eight percent of the seed needs of farmers in India.

## Utilization of Agro-services

The result in Table 3 indicated that services of agro-inputs retailers ( $\bar{x}$ =3.15), extension agencies ( $\bar{x}$ =3.07), fertilizer companies ( $\bar{x}$ =2.62) and agricultural finance institutions ( $\bar{x}$ =2.51) were well utilized by most of the respondents in the study area. These findings suggested that agro-inputs dealers, extension workers, fertilizer companies and agricultural finance institutions were having impact on the farmers in the study area. Despite the accessibility of tractor hiring schemes, the service was not well utilized  $(\bar{x}=2.34)$  by majority of the respondents because of high cost. Also, the services of government owned seed companies ( $\bar{x}$ =1.90), weather information agencies such as Nigerian Metrological Agency {NIMET}( $\bar{x}$ =1.13) and irrigation services of River Basins  $(\bar{x}=1.06)$  were not well utilized by most of the respondents. The inaccessibility and minimal utilization of services of seed companies and irrigation schemes is unhealthy for adoption of improved seed varieties and dry season farming in the study area. Therefore, private companies would play an increasingly essential role in this regard. In a related study by Umar et al. (2018) reported a low irrigation facility in the rural farming communities.

## Factors Influencing Utilization of Agro-services

The result of the Multinomial logit regression analysis of the factors that influence utilization of agro-services by the farmers in the study area is presented in Table 4. The effect coefficients were estimated with respect to no utilization of services at all as the reference group. Therefore, the inference from the estimated coefficients for each category was made with reference group. A likelihood ratio ( $\chi^2$ ) value of 211.67 which was significant at 0.01 level of probability was obtained. This test confirms that all the slope coefficients are significantly different from zero. In other words, the explanatory variable are collectively significant in explaining the utilization of agro-services by the respondent in the study area. The results of the estimated equations are discussed in terms of the significance and signs of the parameters.

The result revealed that perceived economic benefits of agro-services was positive and significantly associated with the classification of all the three groups relative to the reference group. The positive sign implies that the probability of falling into any of the group will increase with higher perceived economic benefits of agro-services by the three classification relative to the reference group; indicating that the chance of belonging significantly associated with group two and to those groups will increase with more education. Conversely, age was negative as significantly associated with group three and four classifications, which implied that a cost of services and distance to sources of services were negative and significantly size was also negative and significantly associated with group two and three classifications relative to the reference group, while the significantly associated with group two and significantly associated with group two and three classifications relative to the reference group, while the significantly associated with group two but positive for the group two and the

group four classifications relative to the reference group.

More so, farming experience was negative and significant for group two but positive farmers' association for group four classifications relative to the reference group.

and significant for group four classifications relative and significant for group two but positive farmers' association for group three and income for group four classification were positive farmers' group activities in the study area. The result further revealed that sex was negative group relative to the reference group.

In essence, all the variables except place group.

## Challenges for the Accessibility and Utilization of Agro-services

Table 5 revealed that high cost (60.1%) was a major challenge for the accessibility and utilization of agro-services, particularly tractor hiring schemes in the study area. This suggests that the tractor hiring schemes are not affordable to farmers in the area. For more than half (54.9) of the respondents, the inaccessibility and none or low utilization of the services of seed companies was due to far distances, while unavailability of facilities and inadequate awareness were responsible for low utilization of irrigation and weather information services with 45.7% and 38.4% response rates, respectively. This implies that farmers in the study area will not be able to use these agro-services optimally for production because of far distances to the sources of services, inadequate information and

## CONCLUSION

Based on the findings of the study, it was concluded that most of the farmers in FCT-Abuja were in their active ages, with membership of farmers' associations. The agro. services of seed companies and irrigation agency mostly operated by government were not well accessed and utilized by the respondents. Factors that solely influenced the utilization of agro-services positively were perceived economic benefits of services, educational level association membership and income of farmers. Major challenges for the accessibility and utilization of agro-services were high cost, far distances as well as unavailability of facilities.

Agricultural extension workers should educate the farmers more on the economic benefits of using agro-services to maximize the usage of the services and output by the farmers in the study area. Following high association membership of the respondents, the agricultural extension agents should encourage the farmers to access agro-services in groups through their associations, for enhanced capacity to use agro-services at reduced prices. In view of the essential role played by the private service providers, government should encourage private service providers, government should encourage private service providers through appropriate policies to extend their services to areas where the course providers through appropriate policies to extend their services to areas where the public services are not accessible. Irrigation services of River Basin Development Authorities should be extended to the study area to improve dry season
